Streck manual ESR rack provides results in 30 minutes

Omaha, NE – Streck announces the addition of a manual rack for the measurement of Erythrocyte Sedimentation Rate. The ESR-10 Manual Rack uses ESR-Vacuum Tubes™, a direct-draw blood collection tube that does not require an additional transfer step prior to analysis. ESR results are available in 30 minutes versus the standard 60-minute Modified Westergren method.

The manual rack completes Streck's line of ESR products, which includes the ESR-Auto Plus™ and ESR-100™ analyzers, blood collection tubes and ESR-Chex controls. The ESR-10 provides customers with an additional option for sed-rate testing.

An ESR-10 starter kit includes the ESR-10 Manual Rack, a 30-minute measuring scale, package insert and three boxes of 1.2ml ESR-Vacuum Tubes.

Streck ESR-Vacuum Tubes offer a stability feature, which allows technologists to collect patient specimens and store them for up to 72 hours at refrigerated temperatures without compromising the integrity of the sample. This extended stability is especially useful for facilities transporting patient samples to a centralized location for analysis.

Over the past 30 years, Streck has developed a reputation for excellence that includes consistent, high quality products and responsive customer service and technical service teams. For more information, call 800-843-0912 or consult Streck online at www.streck.com.
